## European Technical Assessment

## ETA 23/0553 of 13/07/2023

| <b>Technical Assessment Body issuing the E</b><br>for Construction Prague                                    | TA: Technical and Test Institute   |
|--|--|
| Trade name of the construction product   | Adit Chemical500 v4  |
| Product family to which the construction product belongs   | Product area code: 33<br>Bonded injection type anchor for use in<br>cracked and uncracked concrete |
| Manufacturer   | ADIT LTD<br>Industrial Zone Kanot<br>23 Adom Street<br>Israel                                      |
| Manufacturing plant  | Adit Chemicals 01  |
| This European Technical Assessment contains  | 22 pages including 19 Annexes which form an integral part of this assessment.                      |
| This European Technical Assessment is issued in accordance with regulation (EU) No 305/2011, on the basis of | EAD 330499-01-0601<br>Bonded fasteners for use in concrete   |

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body - Technical and Test Institute for Construction Prague. Any partial reproduction has to be identified as such.

## 1. Technical description of the product

The Adit Chemical500 v4 with steel elements is bonded anchor (injection type).

Steel elements can be galvanized or stainless steel threaded rods or rebars.

Steel element is placed into a drilled hole filled with injection mortar. The steel element is anchored via the bond between metal part, injection mortar and concrete. The anchor is intended to be used with various embedment depth up to 20 diameters.

The illustration and the description of the product are given in Annex A.

### 2. Specification of the intended use in accordance with the applicable EAD

The performances given in Section 3 are only valid if the anchor is used in compliance with the specifications and conditions given in Annex B.

The provisions made in this European Technical Assessment are based on an assumed working life of the anchor of 50 years and 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the products in relation to the expected economically reasonable working life of the works.

## 3. Performance of the product and references to the methods used for its assessment

#### 3.1 Mechanical resistance and stability (BWR 1)

| Essential characteristic  | Performance           |
|---|-----------------------|
| Characteristic resistance to tension load (static and quasi-static loading)             | See Annex C 1 to C 5  |
| Characteristic resistance to shear load (static and quasi-static loading)               | See Annex C 6 to C 7  |
| Displacements under short-term and long-term loading                                    | See Annex C 8         |
| Characteristic resistance and displacement for seismic performance categories C1 and C2 | See Annex C 9 to C 11 |

### 3.2 Hygiene, health and environment (BWR 3)

No performance determined.

### 3.3 General aspects relating to fitness for use

Durability and serviceability are only ensured if the specifications of intended use according to Annex B 1 are kept.

## 4. Assessment and verification of constancy of performance (AVCP) system applied with reference to its legal base

According to the Decision 96/582/EC of the European Commission<sup>1</sup> the system of assessment verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) given in the following table apply.

| Product           | Intended use                               | Level or class | System |
|-------------------|--|----------------|--------|
| Metal anchors for | For fixing and/or supporting to concrete,  |                |        |
| use in concrete   | structural elements (which contributes to  | -              | 1      |
|                   | the stability of the works) or heavy units |                |        |

<sup>&</sup>lt;sup>1</sup> Official Journal of the European Communities L 254 of 08.10.1996

## 5. Technical details necessary for the implementation of the AVCP system, as provided in the applicable EAD

The factory production control shall be in accordance with the control plan which is a part of the technical documentation of this European Technical Assessment. The control plan is laid down in the context of the factory production control system operated by the manufacturer and deposited at Technický a zkušební ústav stavební Praha, s.p.<sup>2</sup> The results of factory production control shall be recorded and evaluated in accordance with the provisions of the control plan.

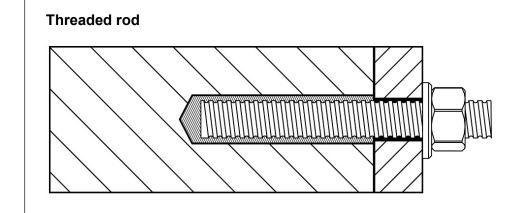

Issued in Prague on 13.07.2023

By Ing. Jiří Studnička, Ph.D. Head of the Technical Assessment Body

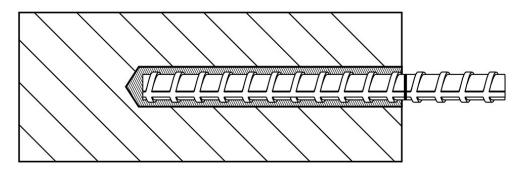

1 d

<sup>&</sup>lt;sup>2</sup> The control plan is a confidential part of the documentation of the European Technical Assessment, but not published together with the ETA and only handed over to the approved body involved in the procedure of AVCP.

### Adit Chemical500 v4

**Product description** Rebars and materials

### Specifications of intended use

## Anchorages subject to:

- Static and quasi-static load
- Seismic actions category C1 (max w = 0,5 mm):
  - threaded rod size M8, M10, M12, M16, M20, M24, M27, M30
    rebar size Ø10, Ø12, Ø16, Ø20, Ø25, Ø32
- Seismic actions category C2 (max w = 0,8 mm): threaded rod size M12, M16, M20

### **Base materials**

- Cracked and uncracked concrete
- Reinforced or unreinforced normal weight concrete of strength class C20/25 at minimum and C50/60 at maximum according EN 206:2013.

#### Temperature range:

• -40°C to +70°C (max. short. term temperature +70°C and max. long term temperature +50°C)

### **Use conditions (Environmental conditions)**

- (X1) Structures subject to dry internal conditions (zinc coated steel, stainless steel, high corrosion resistance steel).
- (X2) Structures subject to external atmospheric exposure (including industrial and marine environment) and to permanently damp internal condition, if no particular aggressive conditions exist (stainless steel A4, high corrosion resistant steel).
- (X3) Structures subject to external atmospheric exposure and to permanently damp internal condition, if other particular aggressive conditions exist (high corrosion resistant steel).

Note: Particular aggressive conditions are e.g. permanent, alternating immersion in seawater or the splash zone of seawater, chloride atmosphere of indoor swimming pools or atmosphere with extreme chemical pollution (e.g. in desulphurization plants or road tunnels where de-icing materials are used).

#### **Concrete conditions:**

- 11 installation in dry or wet (water saturated) concrete and use in service in dry or wet concrete.
- I2 installation in water-filled (not sea water) and use in service in dry or wet concrete

### Design:

- The anchorages are designed in accordance with the EN 1992-4 under the responsibility of an engineer experienced in anchorages and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor is indicated on the design drawings.
- Anchorages under seismic actions (cracked concrete) have to be designed in accordance with EN 1992-4.

#### Installation:

- Hole drilling by hammer drilling, dustless drilling or diamond core drilling mode.
- Anchor installation carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site.

#### Installation direction:

• D3 – downward and horizontal and upwards (e.g. overhead) installation

### HDB – Hollow Drill Bit System

Heller Duster Expert hollow drill bit SDS-Plus ≤ 16mm SDS-Max ≥ 16mm

Class M vacuum Minimum flow rate 266 m3/h (74 l/s)

### **Brush extensions**

-

### **Applicator gun**

Annex B 2

1007

Hollow drill bit system, Cleaning brush Applicator guns

#### SOLID SUBSTRATE INSTALLATION METHOD

1. Using the SDS hammer drill (HD) in rotary hammer mode for drilling, with a carbide tipped drill bit of the appropriate size, drill the hole to the specified hole diameter and depth.

2. Select the correct air lance, insert to the bottom of the hole, and depress the trigger for 2 seconds. The compressed air must be clean and free from water and oil, with a minimum pressure of 90 psi (6 bar). Perform the blowing operation twice.

3. Select the correct size hole cleaning brush. Ensure that the brush is in good condition and of the correct diameter. Insert the brush to the bottom of the hole, using a brush extension if needed to reach the bottom. Withdraw with a twisting motion. There should be a positive interaction between the bristles of the brush and the sides of the drilled hole. Perform the brushing operation twice.

4. Repeat step 2 (blowing operation x2)

5. Repeat step 3 (brushing operation x2)

6. Repeat step 2 (blowing operation x2)

7. Select the most appropriate static mixer nozzle, checking that the mixing elements are present and t for purpose. Never modify the mixer. Attach the mixer nozzle to the cartridge. Check the dispensing tool is in good working order. Place the cartridge into the dispensing tool.

8. Extrude some resin to waste until an even coloured mixture is achieved. The cartridge is now ready for use.

9. Insert the mixing nozzle to the bottom of the hole. Extrude the resin and slowly withdraw the nozzle from the hole. Ensure no air voids are created as the nozzle is withdrawn. Inject resin until the hole is approximately <sup>3</sup>/<sub>4</sub> full and remove the nozzle from the hole.

10. Select the steel anchor element ensuring it is free from oil or other contaminants, and mark with the required embedment depth. Insert the steel element into the hole using a back and forth twisting motion to ensure complete cover, until it reaches the bottom of the hole. Excess resin will be expelled from the hole evenly around the steel element and there shall be no gaps between the anchor element and the wall of the drilled hole.

11. Clean any excess resin from around the mouth of the hole.

12. Refer to the working and loading times within the tables to determine the appropriate cure time.

13. Position the fixture and tighten the anchor to the appropriate installation torque. Do not over-torque the anchor, as this could adversely affect its performance.

C

#### **DEEP EMBEDMENT & OVERHEAD INSTALLATION METHOD**

1a. Perform steps 1-8 under "solid substrate installation method".

2a. Attach the correct diameter and length extension tube to the nozzle. Select the correct diameter resin stopper for the application, then push and screw the extension tube into the resin stopper. This is held in place with a coarse internal thread. The resin stopper is a reusable accessory.

∎╧━═╪╧┇

3a. Push the resin stopper and extension tube to the back of the drill hole.

4a. Ensure the extension tube is angled to allow free movement of the resin stopper as the resin is extruded.

5a. Continue from step 10 under "solid substrate installation method".

#### **DIAMOND CORE DRILLING**

1b. Using a diamond core drill (DD) and following the manufacturer's instructions, drill the specified diameter hole to the correct embedment depth then remove the concrete core.

2b. Starting from the back of the hole, flush with pressurised water a minimum of two times and until there is only clean water.

3b. Select the correct size hole cleaning brush. Ensure that the brush is in good condition and of the correct diameter. Insert the brush to the bottom of the hole, using a brush extension if needed to reach the bottom. Withdraw with a twisting motion. There should be a positive interaction between the bristles of the brush and the sides of the drilled hole. Perform the brushing operation twice.

4b. Repeat step 2b (ushing operation x2).

5b. Repeat step 3b (brushing operation x2).

6a. Using the correct air lance and starting from the back of the hole and withdrawing, perform a minimum of two blowing operations and ensure that the hole is clear of debris and excess water.

7a. Continue from step 7 under "solid substrate installation method".

#### DUSTLESS DRILLING

1c. Using the specified hollow drill bit (HDB) and vacuum system and following the manufacturer's instructions, drill the specified diameter hole to the correct embedment depth. Ensure that the minimum vacuum specifications are met and that the vacuum is turned on.

2c. The hole should be inspected to ensure the system has worked correctly. If the hole is clear of dust and debris, no further cleaning is required.

3c. Continue from step 7 under "solid substrate installation method".

|                                   | Ensure cartridge is ≥ 10°     | C                 |                 |

T Work is typical gel time at highest base material temperature in the range.

T Load is minimum set time required until load can be applied at the lowest temperature in the range.
